## Biggleswade Sound Technology Division Launched

Custom Electronics began designing high technology digital audio systems over 27 years ago, producing one of the countries first digital audio recorders. Now, alongside their mainstream activities in real-time software and hardware for broadcast, control, automation, aerospace and military activities; the company has decided to focus their experience in this area into a new Custom Sound Technology division providing the latest in computerised sound system consultancy, together with an exciting new Recording Studio and Rehearsal centre in Biggleswade.

The facilities are general purpose, for all types of sound projects ranging from music production, through corporate, to broadcast.

### **Recording Studio and Multi-Media Production:**

The Custom Sound Technology recording studio is self-contained, with performance studio and separate computerised engineering control room. The latest digital technology is available to ensure the highest standard of sound recording, storage, mixing and production for all types of project.

Designed principally with live musicians in mind, the facilities are highly performance friendly, allowing the artists to easily move from rehearsal to recording stages without losing creativity.

The recording atmosphere is close and not disturbed by the engineering technology of the separate control room. An extensive artists mixing and monitoring system means that even full bands can be recorded "live" if desired, using an independent monitoring system.

The studio also has an Overview "PylonCam" installed, which publishes studio pictures through the companies internet website. This can also be controlled by a local operator to record session video clips, and even be interrogated and controlled remotely by email.

### **Features: -**

- Large studio area
- Performance isolation from engineering
- Full live-band capabilities
- Independent artists monitoring mix
- Latest computerised recording
- Multi-channel concurrent recording
- Digital effects processing
- Computerised mix-down automation
- High quality monitoring
- Automated live video recording
- Live Internet website publishing

The studio is already busy, but is committed to supporting local musicians as well as their larger clients.
